Lab 2 – Activities

Objectives: Understanding user requirements

- Reviewing your project
- Discuss and revise the product backlog of your project. Each item in the product backlog is a user story following a simple template, as follows [1]:

  As a <type of user>,
  I want <to perform some task>
  so that I can <achieve some goal/benefit/value>.

- Each member selects TWO items in the product backlog and designs **prototypes** for the items [2]. You can use any design tools, such as, MS Visio, Visual Studio, Eclipse, or Weebly.com.

- Interview: ask a member in different group to get feedback and improve your prototypes, write down what you need to change. (For the online session, two groups will be put in one room for discussion.)

- Each member describes the use cases of the prototyped items following the provided template.

- Prepare a requirements specification document including:
  - Contents: referring to Figure 4.17 in the textbook [3] / the provided *requirements specification* template.
  - In this lab, groups need to draft the *system requirements* part which should include, functional and non-functional requirements, [user stories,] Use Cases and their specifications. Students might refer to the templates of Use Case description in the textbook.
  - Prototyping: referring to [2]
    - In this lab, groups also need to design main user interface appropriately for each user story (or Use Case)
- Apply the requirements engineering process: identify user requirements, prototyping + interview, specifying system requirements (func. and non-func. reqs.)
- At the end of the lab, the tasks of all groups need to be checked if they are completed as stated in the sprint backlog. **Submit the report of sprint planning meeting.**

Notes:

Students need to use a sprint backlog for their group meetings, a *sprint backlog template* (project_sprint_backlog.xls, see sheets Release Plan, Product Backlog, Sp1). The template is just for reference, the important thing is students should write their tasks for each week, e.g., time, members – roles, tasks and plan (how many hours/days to complete a task). See more templates provided on the Blackboard.

Students need to show documents: Product backlog in group, prototypes (before and after interviewing) in individual, and use case descriptions in individual.
